Testing HTTP Methods

Overview

Various API Testing Tools

Testing using VS.Net

Various API Testing Tools

- **Postman**: Postman is a widely-used API testing tool that provides a user-friendly interface for sending HTTP requests, inspecting responses, and automating API testing.
- **Swagger** :Swagger is an open-source framework that allows you to design, build, and document RESTful APIs. It provides a specification format (OpenAPI Specification) for describing APIs, and there are various tools available for generating API documentation and testing the endpoints based on the specification.
- **Telerik Fiddler**: commonly known as Fiddler, is a free web debugging proxy tool developed by Telerik (now Progress Software). It is widely used by developers, testers, and other professionals involved in web development and API testing.

Testing using VS.Net

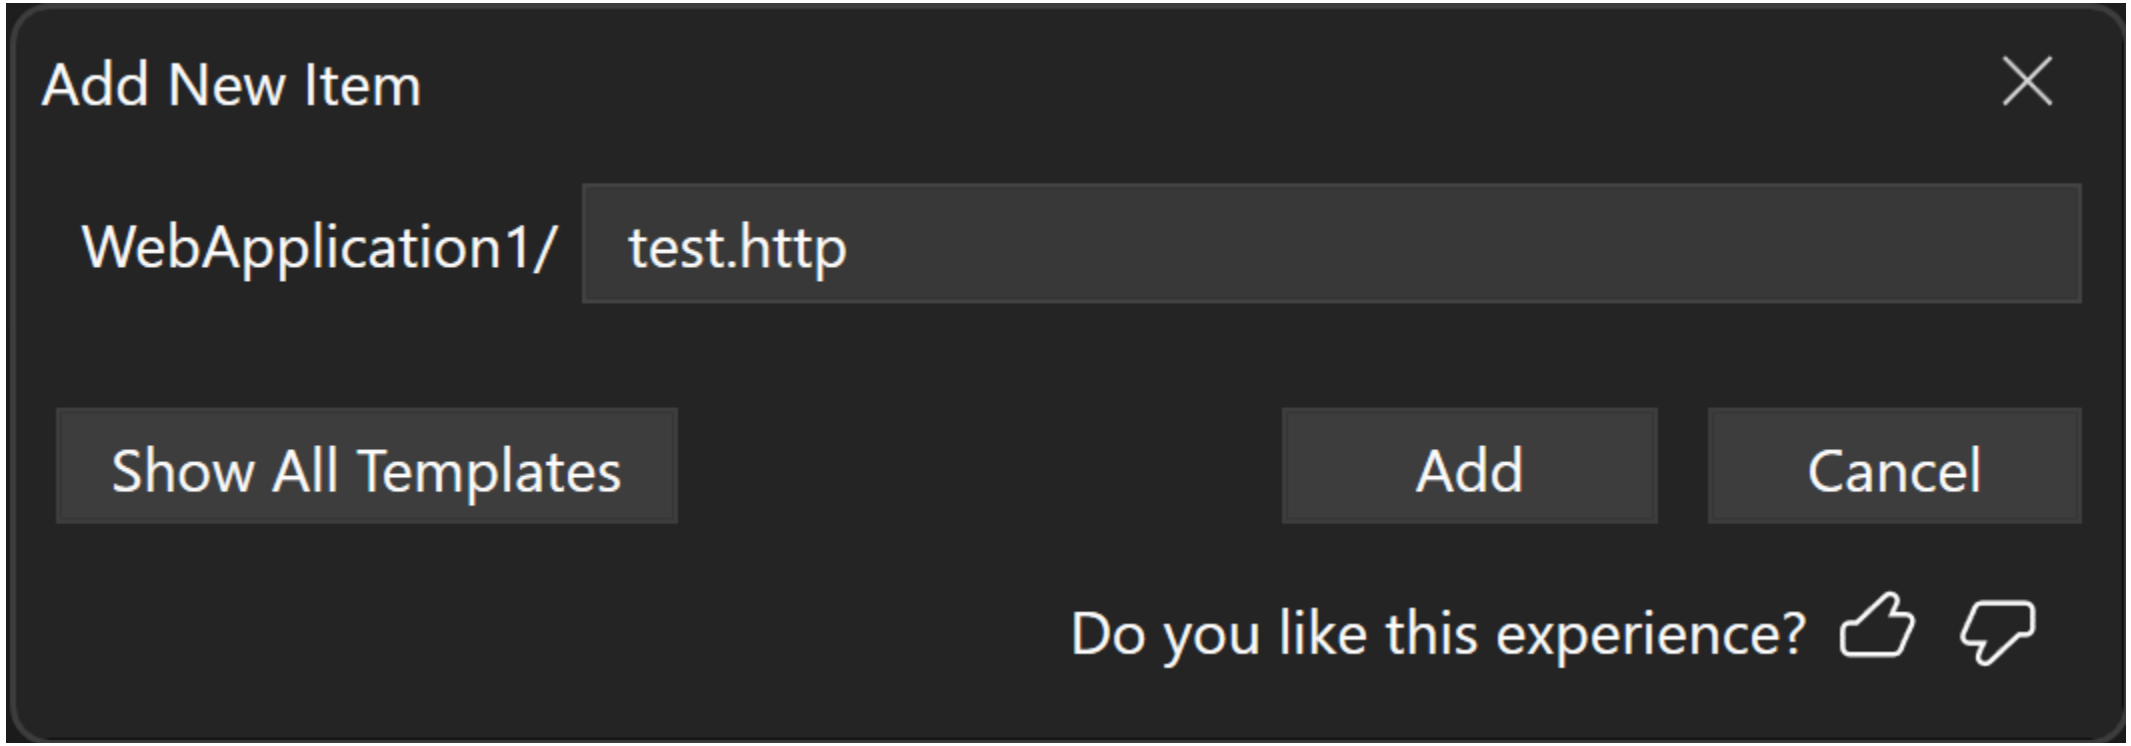

- **Step 1: Create a new ASP.NET web API project**
- **Step 2: Create a new controller**
- **Step 3: Add GET and POST methods to the controller**

```
[HttpGet]
public string Get()
{
    return "Hello, world!";
}

[HttpPost]
public string Post([FromBody] string name)
{
    return "Hello, " + name + "!";
}
```

- **Step 4: Add a .http file to the project**

Add a new item to the project by right-clicking on the project name in the Solution Explorer and selecting "Add" > "New Item..."

- **Step 5: Write HTTP requests in the .http file**

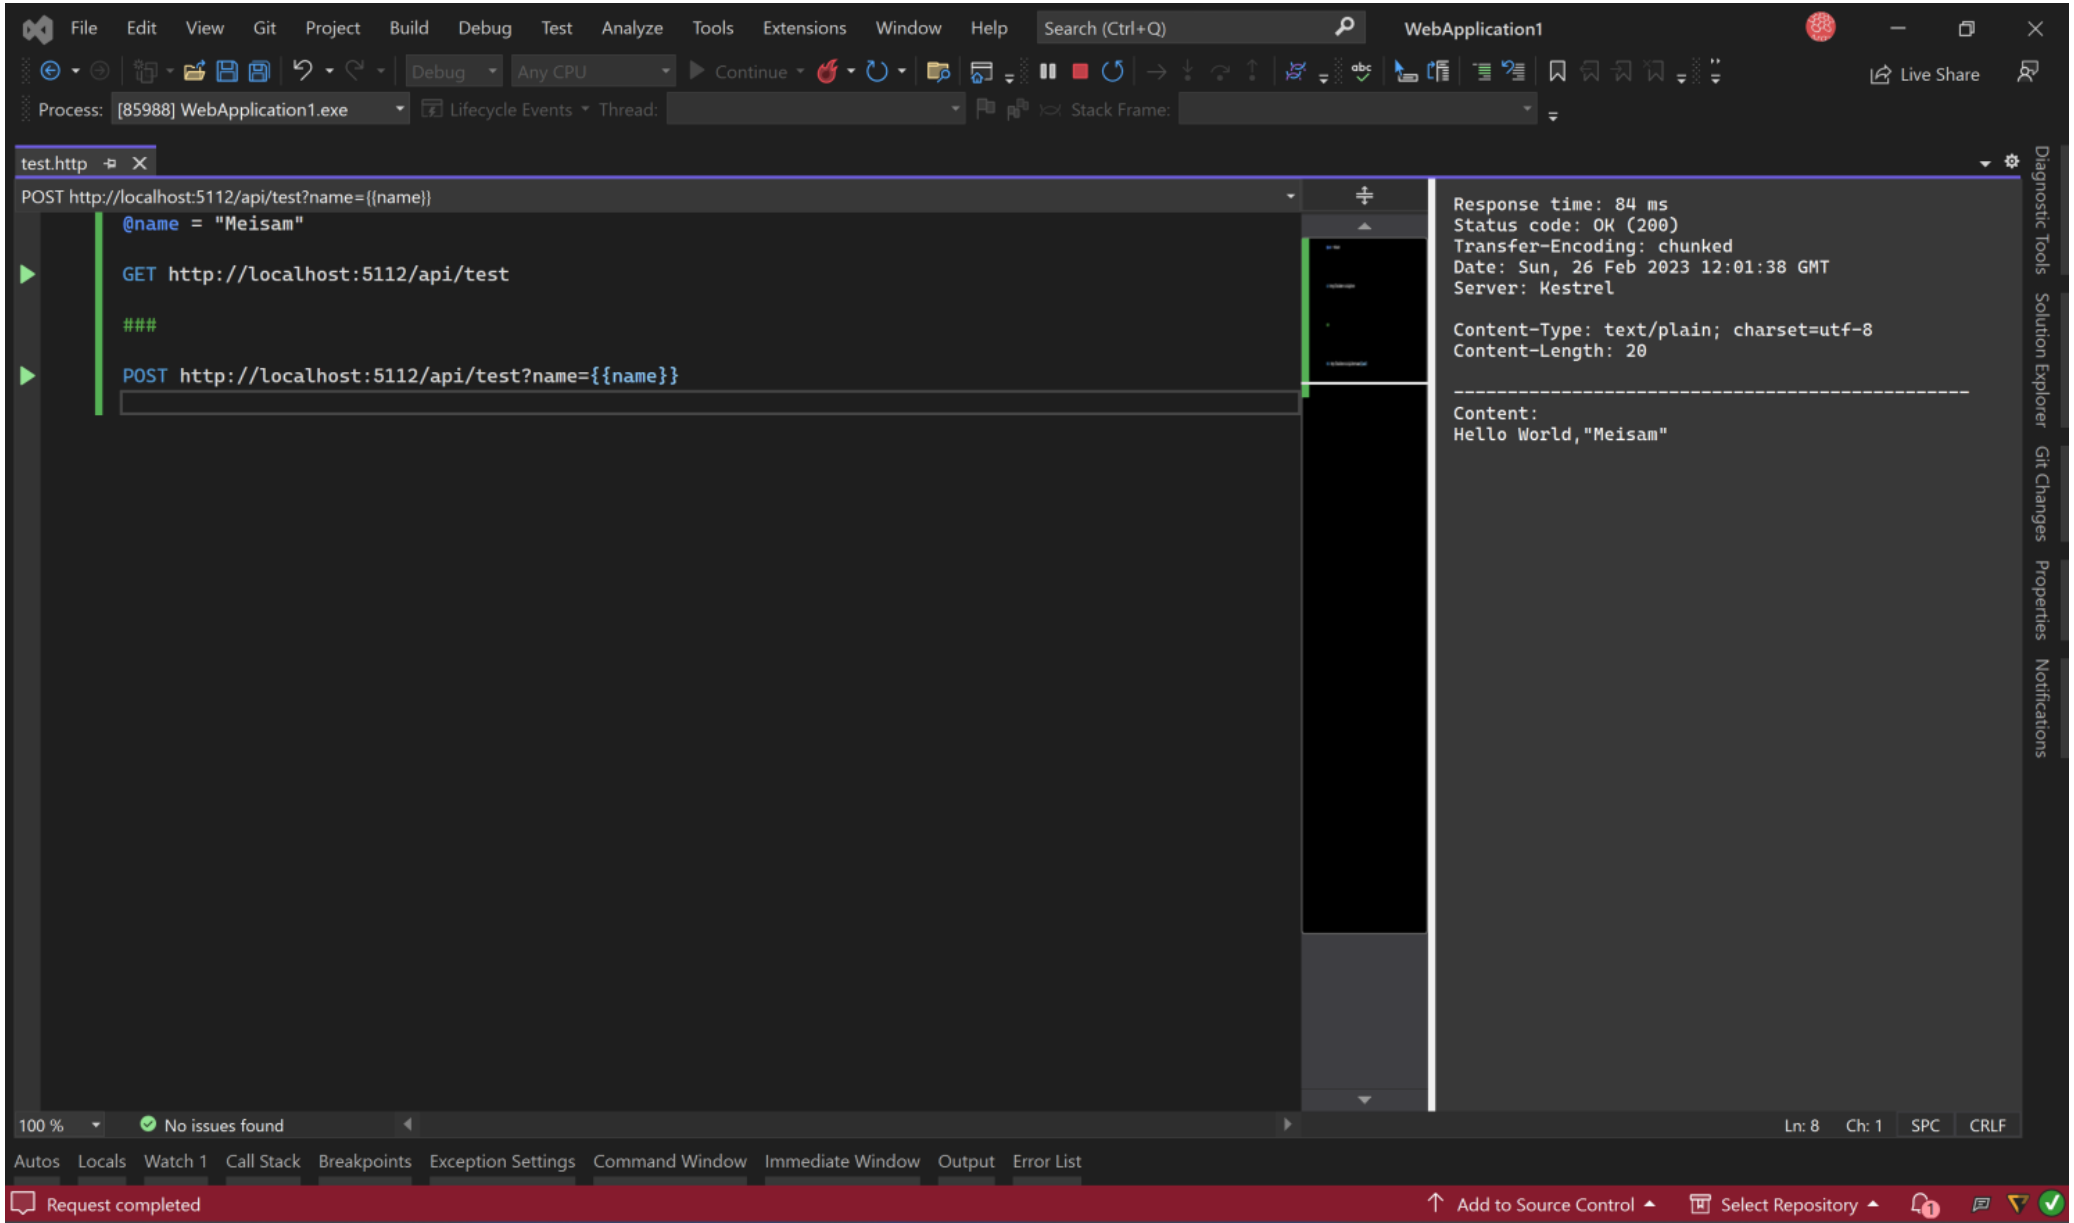

In the test.http file, write the HTTP requests that you want to test.

```
@name = "Meisam
GET http:s//localhost:5112/api/test

###

POST http:s//localhost:5112/api/test?name={{name}}
```

- **Step 6 :Test the HTTP requests:** Click the "Run" button next to each request in the test. http file to test the corresponding endpoint.
